a week of traces, minute by minute

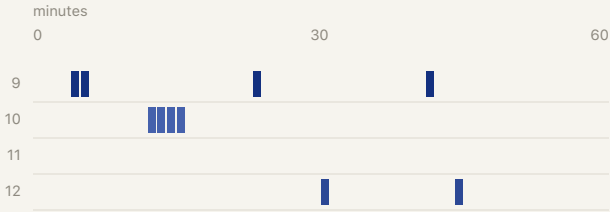

Most of what a computer does with your day is never shown to you. It copies, it overwrites, it warms up, it fills and empties. This book keeps a week of it.

saturday 10 october 2026 to thursday 15 october 2026, logged on one laptop.

how to read it

Every day is two pages. On the left, a timeline: one row for each hour, one column for each minute, one tick for each thing that happened. On the right, the same day written out.

Where nothing was logged the row is left empty. The empty rows are part of the book.

contents

1 **clipboard** 7
Everything copied, in the order it was copied.

2 **deleted text** 39
Every word typed and then taken back, with what replaced it.

3 **heat** 65
The battery temperature, once a minute.

4 **notifications** 81
Every alert that reached the screen.

2,348

minutes logged out of 8,640. The rest are empty on purpose.

88 copies
747 deletions
29.8 to 31.2 °C
265 notifications

clipboard

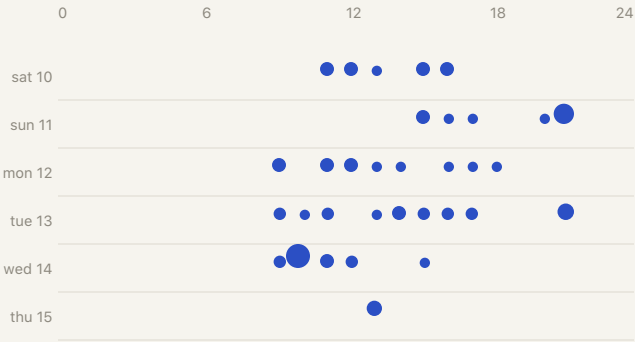

Everything copied, in the order it was copied. A tick on the timeline is one copy: the taller it is, the more text it held. The colour is the site it came from.

colour is the site

Within the colour, deeper means more common. Grey is everything else.

the week

one row a day, one dot an hour. The bigger the dot, the more happened.

Networking Call Script: Shantanu Sharma Oct 14, 2026 · @ Keyaa Kapadia Quick prep Shantanu is a Design Director at 72andSunny who came up through SVA, so your goal is a warm, curious conversation that ends with him agreeing to look at your portfolio. Who he is • Design Director at 72andSunny; BFA Design (with honors) from SVA; Adjunct Professor at SVA since 2025. Previously Senior Designer at Wieden+Kennedy (SVA faculty page, his site). • Earlier stints at Isometric Studio, Visual Arts Press and the Type Directors Club, from his student days (Print: The Student Portfolio). • Work includes Nike FC Footballverse, Nike What The Football, Nike World Cup ‘23, Panera Bread identity and KFC campaigns; recognized by Cannes Lions, D&AD, The One Show and ADC (his site). • Has guest lectured at Parsons (2023) and SVA, and sits on juries including AIGA TNS (his site). He also did an SVA alumni podcast, “From Illustrator to Ad Agency” (Apple Podcasts); worth a listen before the call. • Instagram: shantanu.sharma. Goals for the call 1. Build a real connection (shared people, shared taste), not a transactional ask. 2. Learn his path from SVA to 72andSunny and how he sees a communication design student positioning herself for agencies. 3. Get recruiting tips plus a read on team structure, hiring and sponsorship. 4. Earn permission to send your reworked portfolio for feedback. Before you dial • Open his Instagram and pick one or two specific tools or posts you can describe in your own words (I could not view his Instagram feed from here, so I left placeholders below). • Have your portfolio link ready to paste in chat or email. • Keep this to the time he gave you; offer to wrap up at the 15 or 20 minute mark. Opening: warm up with the shared connections (first 2 minutes) Start with thanks, then go straight to the people you have in common, since that is what makes this feel like a conversation and not a cold ask. “Hi Shantanu,

thank you so much for making time. I'm Keyaa, a senior in Communication Design at Parsons. I've been looking forward to this." "I've been seeing a lot of your work on Aarman's stories, and I really love your style. The small tools you've been making especially caught my eye. They feel playful but genuinely useful." "Honestly, you're the kind of designer I'm hoping to grow into: big campaign work, but with your own hand and your own tools in it." "One more small-world thing: I saw you reposted Nandita's story. She was a senior at my high school, and my roommate went to the same university as her, so it was fun to see our worlds overlap." Then pause and let him react. If he mentions the tools, great: that bridges straight into your AI tool exploration in the next section. If he talks about Nandita or Aarman, ask one follow-up question before moving on. "Is it okay if I jump in with a few questions? I'll keep an eye on time." Your intro and the AI tools bridge (minutes 2 to 5) Keep your pitch to about 30 seconds, then connect it to his tools so … and 5,281 more

Katherine Chui She/Her · 2nd Graphics Reporter at The Wall Street Journal … and 2 more

10:41 arc 260 characters

Hi Katherine! I'm Keyaa, a senior studying Communication Design at Parsons. Edison Wu suggested I reach out, and I'd love to hear about your experience going from Parsons to NYT and now WSJ. Would you be open to a quick chat sometime? I'd really appreciate it!

10:47 arc image

When new technologies pose new copyright questions that Congress did not anticipate, courts typically consider which outcome is most consistent with the constitutional purposes of copyright. The Constitution gives Congress the power "to promote the progress of Science and useful Arts," that is, to foster the creation and dissemination of knowledge for the public good. This requires balancing the legitimate interests of copyright owners to prevent misappropriations of their works that undermine incentives to create with the legitimate interests of developers of innovative technologies and follow-on creators who need some breathing space in which they, too, can innovate.

What makes generative AI more disruptive than previous technologies? One factor is certainly the exceptionally rapid pace at which generative AI technologies have been launched, adopted, and adapted. Evolution in the fields of law and policy, by contrast and of necessity, is much slower. It is, moreover, not easy to assess how to calibrate balances among competing copyright interests in the early stages of new-technology evolutions. Generative AI seems poised to have substantial impacts on the careers of professional writers and artists. During the 2023 Writers Guild of America strike, for instance, uses of generative AI are one focus of negotiations. Screenwriters are understandably worried that these technologies will displace them or diminish their compensation.

Stability AI is defending two copyright infringement lawsuits in the United States that are focused on Stable Diffusion, a widely used image generator. Getty Images is the plaintiff in one of these lawsuits. The other is a class-action lawsuit on behalf of visual artists on whose images Stable Diffusion was trained. Both complaints assert that Stability AI made unlawful copies of the plaintiffs' images when ingesting them as inputs for training Stable Diffusion's model and that output images produced by Stable Diffusion in response to user prompts are infringing derivative works.

A third generative AI lawsuit (*Doe v. GitHub, Inc.*) challenges OpenAI's development of Codex, a large language model (LLM) trained upon billions of lines of open-source software code. Also challenged is GitHub and OpenAI's collaborative development of Copilot, a coding assistant tool that draws upon the Codex LLM to suggest lines of code for specific functions in response to user prompts. (Microsoft, which owns GitHub and has invested heavily in OpenAI, is a fellow defendant.)

Rulings in favor of plaintiffs might trigger "innovation arbitrage," causing developers of generative AI systems to move their bases of operation to countries that regard the ingestion of copyrighted works as training data as fair use, like Israel's Ministry of Justice did in early 2023. Other countries that want to attract AI innovations may follow suit. If courts uphold the *Stability AI* plaintiffs' claims, OpenAI's GPT-4 and Google's BARD may also be in jeopardy. Their developers would be very attractive targets of follow-on lawsuits.

INGESTING TRAINING DATA

Stability AI has yet to articulate its main defenses to the copyright charges. Insofar as the complaints allege that Stable Diffusion contains copies of in-copyright images used as training data, the claims are factually and technically inaccurate. Stable Diffusion contains an extremely large number of parameters that mathematically represent concepts embodied in the training data, but the images as such are not embodied in its model.

Training a model begins by tokenizing the contents of works ingested as training data into component elements. The model uses these tokens to discern statistical correlations—often at staggeringly large scales—among features of the content on which the model is being trained. In essence, the model is extracting and analyzing precise facts about, and correlations between, discrete elements of the works to ascertain which other discrete elements either do or do not follow or are proximate to these elements and the frequency with which the correlations do or do not exist in varying contexts.

> **"The complaints against Stability AI overlook the intentionally porous nature of copyrights."**

The complaints against Stability AI overlook the intentionally porous nature of copyrights. What copyright law protects is only the original expression that authors contribute (such as sequences of words in a poem or the melody of music). Copyright's scope never extends to any ideas, facts, or methods embodied in works nor to elements common in works of that kind (under copyright's "scenes a faire" doctrine), elements capable of being expressed in very few ways (under the "merger" doctrine), or the underlying subjects depicted in protected works. Photographs of cats, for instance, do not give the photographer exclusive rights to characteristic features of cats, such as their noses or facial expressions. Nor does copyright's scope extend to inferences that readers might draw from reviewing an author's works, such as insights about patterns of connections among concepts or how works of that kind are constructed.

Moreover, Stability AI did not prepare the dataset on which the Stable Diffusion model was trained. This was done by a nonprofit German research organization known as LAION (Large-Scale Artificial Intelligence Open Network). LAION initially developed LAION-5B, a dataset consisting of 5.85 billion hyperlinks that pair images and text descriptions from the open internet. LAION makes this dataset available to the public for free for use as training data for those who want to use it to build generative models. LAION also developed a subset of LAION-5B, known as LAION-Aesthetics, that consists of hyperlinks to 600 million images selected by some human testers for their visual appeal and by a machine-learning analysis of human aesthetic ratings. The Stable Diffusion model was trained on the LAION-Aesthetics dataset.

LAION's creation of this dataset was very likely lawful because the European Union (EU) adopted an exemption allowing nonprofit research organizations to make copies of in-copyright works for text and data mining (TDM) purposes. The EU created this exception in recognition of the societal value of TDM as a means by which researchers can create new knowledge. This exemption cannot be overridden by contract. (A second EU exemption authorizes commercial actors to engage in TDM, although copyright owners can opt out of this exemption, as some have done.)

Stability AI makes Stable Diffusion available on an open-source basis. However, it also provides a subscription service so that those who lack resources or the inclination to host the open-source version can have access to Stable Diffusion to generate images in response to text prompts. Yet, insofar as ingesting in-copyright images to train a generative model requires making at least temporary or incidental copies of them, Stability AI is likely to argue that this is a fair use under US copyright law.

FAIR USE

Under US law, fair uses of in-copyright works do not infringe copyrights. Courts consider four factors when assessing fair use defenses: (i) the purpose of the challenged use, (ii) the nature of the copyrighted works, (iii) the amount and substantiality of the taking, and (iv) the effect of the challenged use on the market for or value of the

Project 3: Garden (Oct 1 – Oct 22, 2026) Using what you have learned about event listeners, mouse coordinates, and dynamically creating and appending HTML elements, create a virtual garden which implements the ability to render and place elements where you click your mouse. … and 1 more

11:00 arc 1,297 characters

I underlined the sentence, "Generative AI seems poised to have substantial impacts on the careers of professional writers and artists." As a design student, this feels close to the work I am learning to do. It makes me think about how creative work is valued when the finished result can be produced quickly, even though developing the judgment behind it takes years. I would question the sentence, "Evolution in the fields of law and policy, by contrast and of necessity, is much slower." I understand that thoughtful regulation takes time, but "of necessity" makes that delay sound unavoid-

able. If artists are already experiencing changes to their work and compensation, waiting should not automatically be accepted as the only responsible approach. This connects to my virtual garden project this week, where I am using event listeners, mouse coordinates, and dynamically created HTML elements to place objects wherever someone clicks. The visible outcome might be simple, but building it requires understanding how individual decisions shape an interaction. AI could potentially generate similar code quickly, but that would not necessarily give me the same understanding. The paragraph made me consider how speed can obscure the learning and creative decisions involved in making something. … and 2 more

Underlay Copyright Statement, Privacy Policy & Research Documentation for a Speculative AI Design Tool Keyaa Kapadia · BFA Communication Design, Parsons School of Design Building AI · Exercise #3 · October 2026 ## What Underlay Is Underlay is a data visualization tool that reads the patterns in a dataset and generates several different visualizations of it, each rendered in my own design system. The AI doesn't decide what the final piece looks like. It produces studies, and I make the editorial and design decisions. ### How it works 1. **I bring two things:** a dataset, and my design system (typefaces, palette, grid, and two or three past pieces as reference). 2. **Code finds the patterns.** Trends, clusters, outliers, cycles and gaps are calculated with statistical code, not by the language model, because LLMs are unreliable at math on raw data. 3. **The AI explains the patterns.** It writes a plain-language reading of what the data is doing, and every claim links to the rows and statistics behind it, so I can check that nothing is invented. 4. **It generates 6–10 variations.** Each one is a different argument about the same data: stripes for the long-term trend, small multiples for comparing clusters, a radial view for a cycle, a layout built around an outlier. Each comes with a note on what it emphasizes and what it hides. 5. **I curate and design.** I can pick one, combine two, or reject all of them. The variations are studies, not deliverables. ### Where the line is | The AI can | The AI cannot | |---|---| | Describe patterns in the data, with evidence | Invent a visual style or use anyone else's | | Propose different ways to visualize the same data | Rank the variations or choose a "best" one | | Render studies in the designer's own type, palette and grid | Export anything as final without the designer's edits | | Explain what each variation emphasizes and hides | Hide which decisions it

made | Underlay is speculative. These documents describe how I would run it if I built and shared it. They are not legal advice. --- # 01 — Copyright Statement **© 2026 Keyaa Kapadia — Underlay** Underlay touches four kinds of work: the tool's code, the data people bring, the design systems they bring, and the visualizations that come out. Each needs its own terms. ## A. The code — Anti-Capitalist Software License (v1.4) Underlay's source code is released under the Anti-Capitalist Software License. Individual designers, students, artists, nonprofits, educational institutions and worker-owned studios may use, copy, modify, share and sell it, as long as this notice stays attached. It may not be used by organizations whose owners aren't workers, or by law enforcement or the military. Underlay is meant to support designers' judgment, not to become infrastructure for automating them out of the work. ## B. Source data keeps its own rights Underlay doesn't change the rights attached to a dataset. Facts themselves generally can't be copyrighted, but datasets ofte … and 13,243 more

heat

The battery temperature, once a minute. Each hour is a small skyline: the taller the tick, the hotter the machine was running. The colour is the heat-map scale.

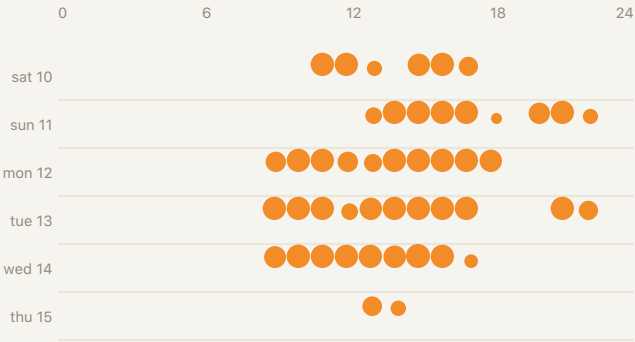

colour is the temperature

29.8 °C 31.2 °C

The standard heat-map scale: cold blue through green and yellow to hot red.

the week

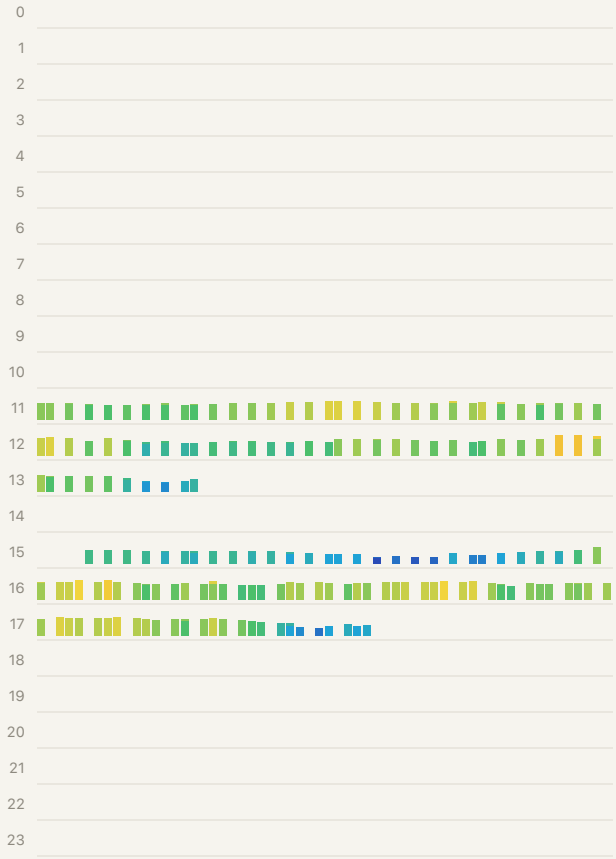

one row a day, one dot an hour. The bigger the dot, the more happened.

4

notifications

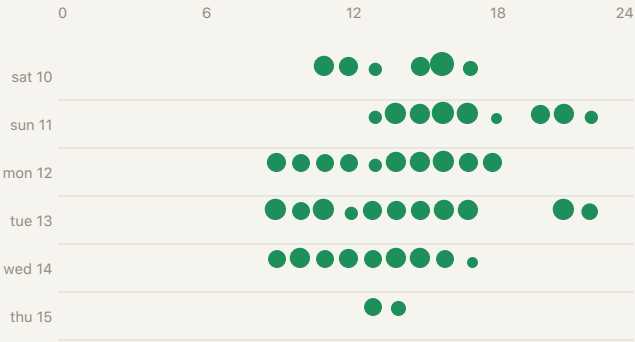

Every alert that reached the screen. A tick is one notification: the taller it is, the longer the message. The colour is the app. Messages from people are kept as length only.

colour is the app

Within the colour, deeper means more common. Grey is everything else.

the week

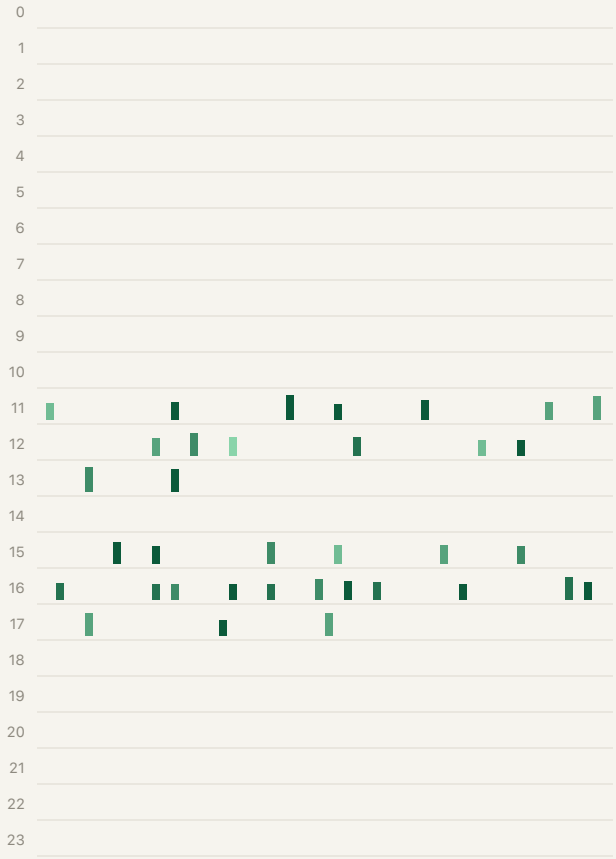

one row a day, one dot an hour. The bigger the dot, the more happened.

colophon

Real data: clipboard, deleted text and system sensors logged on one laptop by a local script, including the site in front when the browser was. Text comes from the masked columns, and anything flagged sensitive was left out. Simulated for this proof: sat 10, sun 11, mon 12, tue 13 (every chapter), and all notifications, which the logger could not read yet. Set in SF Pro. Drawn with basil.js in InDesign.
